WaterQuest Solutions

STOP LEAKING OIL INTO THE FUTURE.

INDUSTRIAL ODOUR CONTROL

HALO

100% PLANT-BASED

Plant-based chemistry. Engineered delivery.

A practical approach to odour management for industry, infrastructure and communities.

A BETTER OPERATING CONVERSATION

Make odour control part of operational performance.

Halo combines a 100% plant-based product with a delivery plan built around the source, the site and the outcome you need.

UNDERSTAND THE COMPLETE ODOUR PATHWAY

Protect relationships

A clear response plan helps your team address concerns from neighbours and communicate what is being assessed.

Focus the investment

Identify the release that matters, then evaluate a defined application before extending treatment across the site.

Support daily operation

Make product use, service access and system status part of the operating brief from the outset.

The commercial goal: an effective response with a credible operating cost.

CHEMISTRY NEEDS CONTACT

Bring the treatment to the odour-bearing air.

Plant-based odour treatment uses interactions between the formulation and odorous compounds. Delivery determines whether that contact can occur.

01 Create the contact zone

An atomising arrangement distributes the selected mixture where it can intercept the release. Coverage, airflow and residence time influence contact.

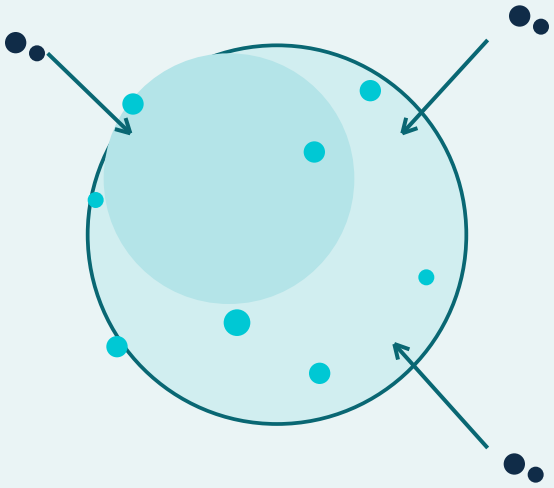

02 Transfer into the liquid

Some odorous compounds can dissolve into treatment droplets. Their affinity for the liquid and the available contact area affect this transfer.

03 Match the chemistry

Formulation-specific interactions, including neutralisation for suitable compounds, can reduce odour. Confirm the applicable mechanism for the selected Halo product.

CONCEPTUAL CONTACT ZONE

Treatment droplet

Liquid contact and formulation-specific interactions

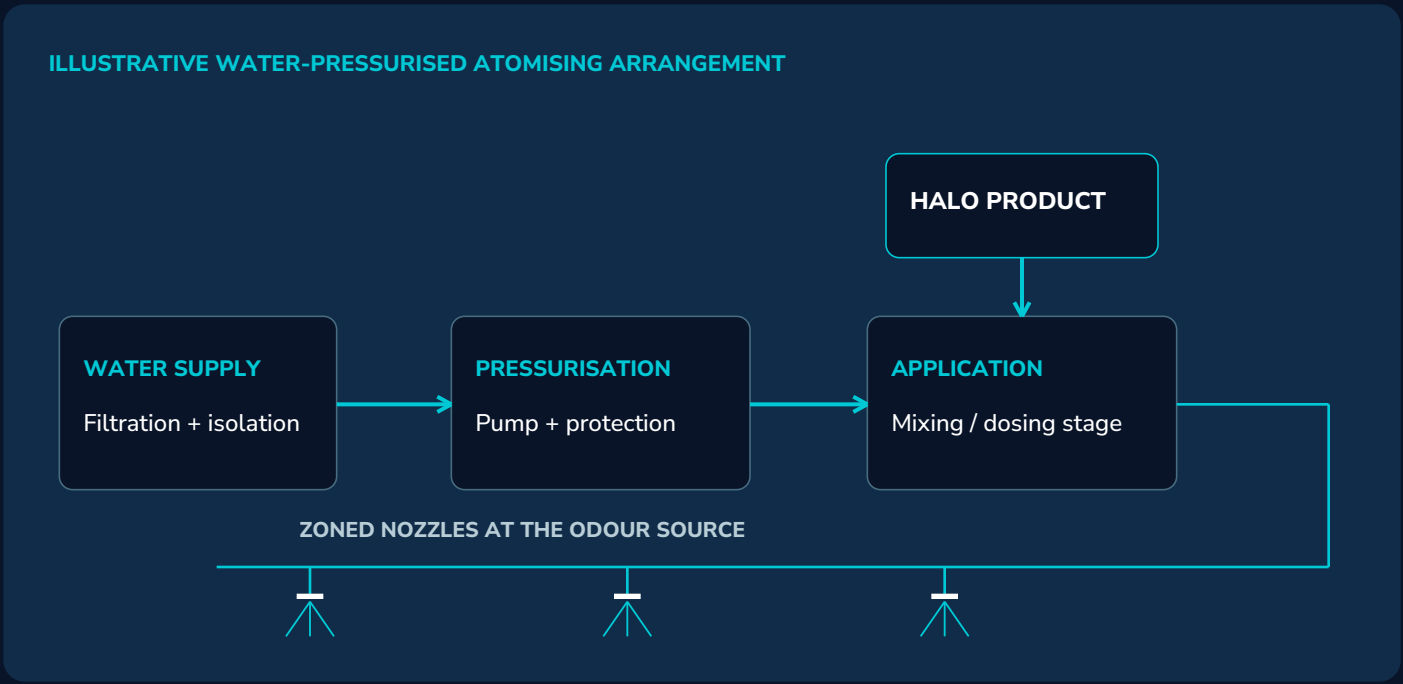

Conceptual illustration of droplet contact; not to scale.

A fragrance changes the scent. An odour-treatment programme must demonstrate a reduction in the odour of concern.

WATERQUEST APPLICATION ENGINEERING

Design the delivery. Control the contact.

Specify the product, water supply, atomisation and operating logic as one application.

Concept only. Final equipment sequence, protection and dose settings follow the approved product and system design.

SUPPLY

Water quality, available flow, pressure, power and filtration.

COVERAGE

Air movement, nozzle location, drift and acceptable wetting.

COMPATIBILITY

Wetted materials, product concentration and cleaning access.

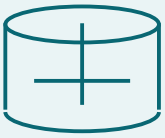

CONTROL

Operating schedule, level indication, faults and usage records.

START WITH THE DUTY

Different sources. A focused application.

Use the source and release pattern to shape the Halo assessment. Suitability depends on the compounds, conditions and selected formulation.

01 / WASTEWATER & BIOSOLIDS

Receiving, storage and sludge handling

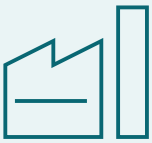

Map tanks, vents and dewatering areas. Distinguish a captured air stream from an open surface, and allow for changing process loads.

02 / WASTE & ORGANICS

Transfer, storage and active handling

Trace releases during tipping, turning and movement. Relate the application zone to operating periods, wind and nearby receptors.

03 / INDUSTRIAL PROCESSING

Production vents and process areas

Characterise the stream, temperature and operating cycle. Check access, materials compatibility and interaction with existing air treatment.

Send a process description and site layout to start your Halo application review.

FIT THE TREATMENT TO THE PROCESS

Choose on engineering fit. Compare on whole-life cost.

Halo can be assessed alongside source control and established air-treatment methods. The appropriate arrangement may combine several measures.

APPROACH	ROLE IN THE PLAN	KEY DESIGN QUESTION
Source control and capture	Contain or collect the release before it disperses.	Can the source be enclosed or the air collected without disrupting the process?
Halo plant-based treatment	Bring a selected formulation into contact with odour-bearing air.	Can chemistry, dose and coverage deliver the agreed response at this site?
Carbon adsorption	Retain suitable compounds on a selected solid medium.	What media capacity, humidity and replacement interval should be allowed for?
Wet chemical scrubbing	Transfer compounds into a liquid and treat them chemically.	What liquid chemistry, contact duty and effluent handling are required?
Biological treatment	Use biological activity to treat suitable captured air streams.	Are the loading, moisture and operating conditions suitable for stable treatment?
Thermal / catalytic treatment	Oxidise suitable compounds in a controlled treatment process.	Do the gas composition, energy duty and emissions requirements support this choice?

Compare installed equipment, consumables, utilities, servicing, waste handling and downtime on the same duty and evaluation period.

EVIDENCE BEFORE EXPANSION

Define success. Then demonstrate it.

An effective trial tests the complete application under representative operating conditions, with agreed measurement points and a clear decision at the end.

1 → 2 → 3 → 4

BASELINE

Record the existing condition.

TRIAL

Apply defined settings.

COMPARE

Review equivalent periods.

REFINE

Adjust, accept or reassess.

BUILD A USEFUL PERFORMANCE RECORD

Odour response	Use a consistent assessment method at agreed locations. Record wind, process activity and the timing of each observation.
Target compounds	Where relevant, use suitable sampling or analysis to track selected compounds. Keep this distinct from perceived odour.
Resource use	Log product consumption, water, energy and operating hours. Compare total operating cost against the defined treatment duty.
System reliability	Record faults, nozzle condition, servicing and availability. Confirm who checks the system and how findings are reviewed.

AGREE THE TARGET + RECORD THE CONDITIONS + REVIEW THE RESULT

HALO BY WATERQUEST

Bring us the source. Let’s define the solution.

Start a Halo application review with the information your team already has. A site sketch, process description and operating history are useful starting points.

A PRACTICAL STARTING BRIEF

1. **Source and process**

   Materials handled, release locations and operating schedule.

2. **Site and airflow**

   Layout, enclosure, ventilation and nearby receptors.

3. **Existing controls**

   Current treatment, available utilities and maintenance access.

4. **Evidence and outcome**

   Odour observations, sampling results and your success criteria.

100% PLANT-BASED

For product selection, request the current technical data, safety data sheet and application instructions. Dose and performance are established for the selected formulation and site.
