APPLICATION BRIEF · MARINE

Marine and coastal actuation

Remove an oil source from equipment close to the water.

A clean freshwater hydraulic circuit can serve a marine mechanism without using seawater as its working fluid. External salt exposure, vessel motion, preservation and the vessel’s approval requirements remain separate selection inputs.

Typical duties to assess

Bilge isolation valves · Deck mechanisms and selected auxiliary drives · Coastal gate and valve actuation

Equipment and project scope

Select water-service pumps, cylinders or motors, control valves and a power unit around the duty. The quotation defines equipment, interfaces, documentation and integration responsibilities.

What to establish

Provide load or valve thrust, movement time, required failure response, water chemistry, external exposure, mounting and access. Agree materials, controls, vessel interfaces, approval documentation and the service plan for the exact configuration.

Evidence and boundaries

WaterQuest supplied a DN200 PN6 globe valve with a water hydraulic actuator for bilge isolation. A hand pump provides opening pressure and a spring provides closing bias when that pressure is released through the designed return path. Drawing 748-001 documents the arrangement.

Start with the duty

Send the asset, operating problem, location, required timing and available drawings. We will assess the equipment scope and the evidence needed for a quotation.

Proposed applications are not customer installations or approvals. Confirm ratings and documentation for the selected equipment and project.
