APPLICATION BRIEF · MUNICIPAL

Municipal gates and wastewater

Remove hydraulic oil from a defined actuation circuit.

An actuator above a channel or near a drainage path can create an oil-release exposure. A purpose-designed water circuit removes that circuit's hydraulic-oil inventory while the gate, load holding and fault response are still engineered for the job.

Typical duties to assess

Channel and sluice-gate actuation · Wastewater isolation and backwash valves · Pumping-station isolation and recovery

Equipment and project scope

Select water-service pumps, cylinders or motors, control valves and a power unit around the duty. The quotation defines equipment, interfaces, documentation and integration responsibilities.

What to establish

Begin with full-stroke load, gate geometry, water head, movement time, normal and failure states, clean working-water supply and freeze conditions. Wastewater is not automatically suitable hydraulic working water.

Evidence and boundaries

WaterQuest's stainless sluice-gate workshop build provides an assembly drawing, a build photograph and an operating demonstration. It is evidence of the build; municipal installation, commissioning and field performance are not claimed here.

Start with the duty

Send the asset, operating problem, location, required timing and available drawings. We will assess the equipment scope and the evidence needed for a quotation.

Proposed applications are not customer installations or approvals. Confirm ratings and documentation for the selected equipment and project.
